A contact and soil residual herbicide for season-long weed control in grapes, kiwifruit, pipfruit and stonefruit.
Chateau® is an exciting new development in weed control in orchards and vineyards. Growers now have an economic option for controlling weeds without the need for repeated spraying during the growing season.

Chateau has been tested extensively for efficacy, crop safety and residues, under NZ conditions, on vineyards and orchards across the country. Chateau consistently provided season long weed control in this wide range of climates and crops.

Chateau provides growers with an extremely effective alternative mode of action (MOA) herbicide for use in herbicide resistance management strategies. Chateau may be used either in sequence or in rotation with other effective herbicides of different MOA groups to control herbicide resistant weeds such as ryegrass or to prevent the further development of resistance.

Registered crops
Grapes, pipfruit, kiwifruit, stonefruit

Active ingredient
500g/kg flumioxazin

Mode of Action
A Group E herbicide with contact and foliar activity. Flumioxazin is a PPO inhibitor – involved in the synthesis of chlorophyll.

Mechanism of Action
Germinating seedings pick up flumioxazin as they grow through the treated zone. As soon as they reach the soil surface the flumioxazin reacts with sunlight and causes disruption of cell membranes and death of the plant. This action is very rapid and germinating weeds are not normally seen.

Resistance Management
Chateau will control glyphosate/glufosinate/amitrole resistant ryegrass. A suitable knockdown herbicide will be required to remove established plants first.
Chateau is a proven pre-emergence residual herbicide

**Broad spectrum**
Controls a wide range of broadleaf and grass weeds. Rhizomatous or stoloniferous weeds may emerge through Chateau treated soil or creep in from unsprayed areas. Established weeds must be controlled prior to application of Chateau.

**Long lasting**
Controls weeds for 4-8 months.

**Stays in place**
Stays in place until rainfall or irrigation releases its activity. Does not leach or volatilise.

**Proven performance**
Chateau has been widely used for effective weed control on vines and tree crops around the world for many years, providing residual weed control with no detrimental effects on long term vine and tree health.

**No residues**
When used as directed no residues occur in fruit or vine foliage.

**Soil types**
Safe and effective on a wide range of soil types.

**Convenient**
Pre-packaged water soluble bags – no weighing or handling required.

**Trial No. NUNZ1428**

Trial conducted by Horteye Ltd.

**Location:** Marlborough

**Crop:** Grapes c.v. Reisling

Existing vegetation removed with knockdown herbicide on 1 September and trial treatments applied on 21 October 2015 prior to flowering.

**Assessed for weed ground cover:** 93-97 DAT

In each year 29 weed species were recorded in the trial including bristly hawksbeard, white clover, scrambling speedwell, doves foot, perennial ryegrass, tall fescue, scarlet pimpernel, broadleaved fleabane and tall willow herb.

**Within each weed group:** treatments with different letters are statistically different (P=0.05)

**Within each year:** treatments with different letters are statistically different (P=0.05)

**Photos taken at each assessment.**

DAA = Days After Application

---

**Trial No. NUNZ1534**

Trial conducted by Peak Research

**Location:** Hawkes Bay

**Crop:** Grapes c.v. Sauvignon Blanc

Treatments applied 22 Nov 2015, pre-flowering. All herbicides were tank mixed with 4L/ha WeedMaster 360.

**Assessed for weed ground cover:** 31 March 2016

**Within each weed group:** treatments with different letters are statistically different (P=0.05)
Crop Safety

When applied as per label directions, Chateau has been proven to be safe to young and established trees and vines.

Recommendation:
Do not apply to trees established for less than 1 year.
Do not apply to vines established for less than 2 years.
Do not apply Chateau to green bark.

Chateau in the soil

Chateau poses no threat to soil health:
- Chateau does not leach
- Chateau has no negative effects on earthworms.
- Chateau has no negative effects on soil microorganisms.
- Chateau does not bioaccumulate in the soil

Best practice application to avoid crop damage when using Chateau

Crop Safety:

Chateau has excellent crop safety when used as directed. The only way Chateau can cause damage to the crop is direct contact with roots, foliage or fruit. When Chateau is applied according to label directions root, foliage and fruit contact will not occur.

Application timing and sprayer set up:

Chateau is not volatile – there is no risk of drift of volatile gases.

Chateau can contact foliage or fruit via spray droplet drift resulting in fruit and leaf spotting.

Apply at the correct timing as directed on the label to prevent contact with foliage or fruit.

Prior to application of Chateau conduct a sprayer check and calibration. Chateau must be applied using a ground based low boom using a coarse droplet spray. Ensure that sprayers have the correct nozzles and pressures to achieve a coarse droplet spray quality.

Avoid applying when wind or other environmental conditions are likely to cause droplets to drift onto the crop. Do not apply when wind speeds are less than 3km/hr or >30km/hour.

Dusty Situations:

Chateau treated soil may be blown onto fruit or foliage and under certain conditions spotting may occur. Apply irrigation to moisten soil and prevent dust in situations where there is a risk especially immediately after application. Don’t undertake mowing or disturb the soil until at least 15mm rain or irrigation has occurred after application.

Chateau applied at the correct timing and under the correct conditions poses a low risk.

Planting into Chateau treated ground

While Chateau does not move through the soil to contact roots there is a risk that Chateau may contact roots during the planting process.

When planting new vines or trees within 12 months of a Chateau application remove the top 3cm of soil from a 0.5m radius before the hole is dug. Ensure that none of this removed soil ends up in the planting hole or comes into contact with the new vine/tree.

To ensure correct application of Chateau please read and follow all label directions – including those listed in the RESTRAINTS section.
To achieve weed control for the entire growing season apply Chateau (700-840g/ha) prior to flowering for all crops except pears. (Pears apply before bud break)
> The high rate (840g/ha) will provide more persistent weed control especially in high rainfall regions.

- Chateau must be applied to bare soil.
- Assess the ground under your trees or vines a couple of months before planned Chateau application and immediately prior to application.
  > Remove large or dense vegetation with a suitable knockdown herbicide before applying Chateau. Allow sufficient time for these weeds to die down before applying Chateau.
  > An effective knockdown herbicide should be tank mixed with Chateau if there are small weeds present at application.
  > Dense trash, mulch or prunings must be removed prior to Chateau application to enable good even soil coverage.
- Chateau should be applied to moist soil and requires at least 15mm rainfall or irrigation within 3 weeks of application to fully activate the herbicide.
  > Sprinkler irrigation may be used to pre-moisten and activate the herbicide.
- Avoid soil disturbance after application as this will disrupt the treated zone and allow weeds to emerge through unprotected soil.
- Apply to an even band under the trees or vines.
- Use sufficient water to provide even coverage.
- Don’t apply in high pH (>7) water or allow the spray mix to stand overnight.

### Residues and withholding periods
No detectable residues have been found in produce harvested from Chateau treated crops. No Chateau residues were detected in foliage sampled from grapevines prior to leaf plucking by sheep.

Chateau was detected at very low levels in surviving weeds in Chateau treated areas. Dust from the surrounding bare soil contacting foliage on or very near the soil surface is the likely cause. However, the proportion of weeds in a grazing diet is very low and provided grazing WHP’s are followed residues will not be detected in animal products.

**Chateau WHPs:**
Do not apply after the start of flowering.

**Grazing orchards:**
Do not graze orchards before 2 months after application.

**Grazing vineyards (including leaf plucking):**
Sheep that have been grazing or fed treated crops should be placed on clean feed for 2 months prior to slaughter.

### Compatibility
Chateau is compatible with a range of herbicides including, WeedMaster® G360, WeedMaster TS470, WeedMaster TS540, WeedMaster Dry, Lion® Herbicide, Lion 490 DST, and Biffo® (glufosinate).

Follow all use directions and precautions on the tank mix partner label.
## Use Directions

<tbody>
<tr>
<td>Grapes</td>
<td>Annual poa (Poa annua)</td>
<td>700g – 840g</td>
<td>Use the higher rate for more persistent weed control. CHATEAU Herbicide needs at least 15 mm of rain or irrigation to activate, and therefore is best applied just prior to a period when rain is likely, or should be followed by adequate irrigation. The best application time for CHATEAU Herbicide is during the period following final harvest up to bud break. <strong>DO NOT apply to pears after budbreak.</strong> <strong>DO NOT apply to other crops after the start of flowering.</strong> Apply as a directed spray using even flat fan nozzles onto bare soil in the herbicide strip at the base of vines or trees. When large weeds are present apply a knockdown herbicide at the full rate and then allow weeds to die down before applying CHATEAU Herbicide. If small weeds are present (&lt;5cm height/diameter) apply CHATEAU Herbicide in tank mixture with a knockdown herbicide. Do not allow spray to contact to foliage, suckers, green bark or exposed roots. For residual use CHATEAU Herbicide does not require an adjuvant, but if it is being used with a knockdown herbicide then follow the recommendation for this herbicide.</td>

</table>
Restraints

DO NOT apply by air.

DO NOT apply for residual weed control until significant rain has occurred and at least 15mm rain is expected or can be applied by sprinklers within 3 weeks.

DO NOT apply during the period after bud break, unless using shielded application equipment and applicator can ensure spray or spray drift will not come in contact with fruit or foliage.

DO NOT apply to trees established less than 1 year or vines established less than 2 years.

DO NOT use in crops where the fruiting buds are less than 40cm above the soil. Remove low branches and suckers if they are likely to come into contact with the spray.

DO NOT apply in areas prone to strong winds or to powdery soils or soils that are susceptible to wind displacement unless sprinkler or microjet irrigation can be applied immediately after application to cover the entire sprayed area.

DO NOT use in grapes or kiwifruit that are not trellised or staked unless they are free standing.

DO NOT operate any machinery (e.g. sprayers, mowers, cultivators) that may blow treated soil onto leaves and fruitlets until at least 15mm of rainfall or irrigation has been applied by sprinklers to the treated area.

DO NOT mow, cultivate or otherwise disturb the soil in the treated area between application and harvest unless the operator can ensure the any dust created will not drift onto foliage or fruit.

DO NOT use for residual weed control if a large population of established weeds or large amounts of trash are present as these will prevent the chemical reaching the soil.

DO NOT apply in high pH water (pH>7) or allow spray mix to stand overnight.

DO NOT disturb treated soil surface after application.

DO NOT treat weeds under poor growing or dormant conditions (such as occur in drought, waterlogging, disease, insect damage or following frosts) as reduced control may result. Weeds should be actively growing at time of treatment.

DO NOT apply by misting machines or any other equipment likely to cause excessive drift.

DO NOT apply to farm alleys or roads where traffic may result in treated dust settling onto crops or other desirable vegetation.

DO NOT replant trees or vines within 12 months of an application unless the top 3 cm of soil from a 0.5m radius around the tree/vine to be replaced is removed before the hole is dug. Ensure treated soil does enter the hole or contact the replant.

DO NOT apply more than one application per season.

Buffer Zones: Do not apply within 5m of a waterbody. Do not apply within 15m of downwind non-target plants.

Powerful rewards for loyalty to Nufarm

Every purchase of Chateau earns you valuable reward points in Priority Partnership®, the rewards programme for New Zealand farmers.
