

Credit[®] Xtreme

HANDLING AND MIXING BEST-USE PRACTICES

CREDIT[®] XTREME IS A UNIQUE HIGH-LOAD, MIXED-SALT FORMULATION OF GLYPHOSATE AVAILABLE ONLY FROM NUFARM.

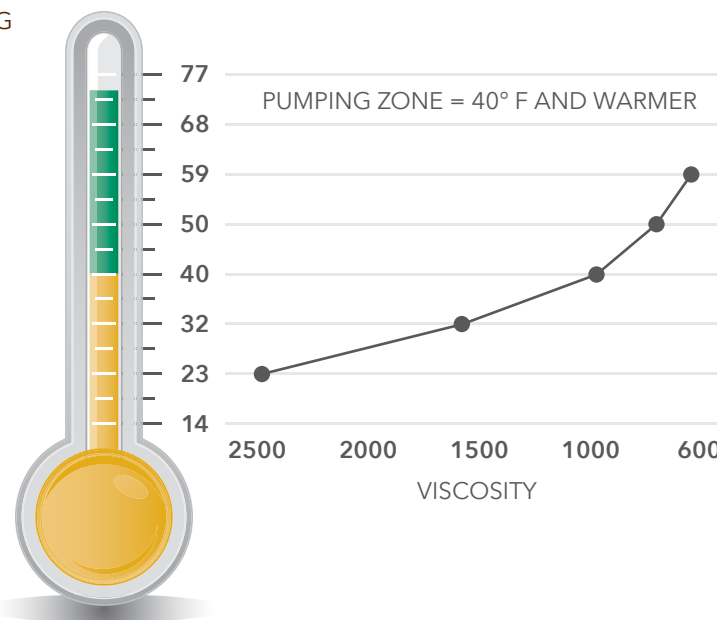

Credit[®] Xtreme offers better plant uptake and excellent tank-mix compatibility with liquid fertilizers and other herbicides, even in cold water. It's rainfast sooner than other glyphosates and easier on glyphosate-tolerant crops in over-the-top applications. And because it's a high-load (4.5 lb acid/gal) formulation, a tote of Credit Xtreme treats 50% more acres than a typical 3.0 lb acid/gal formulation.

BEST-USE PRACTICES FOR CREDIT XTREME

- Always check the label for application rates as Credit Xtreme is more concentrated than many other glyphosate products.
- Because of its high 'load', Credit Xtreme is more viscous than typical glyphosates. In cold weather, it may thicken to the point where it is difficult for some systems to pump. Product in unheated storage where temperatures are averaging below 40° F is most likely to thicken.

SHOULD PRODUCT THICKEN, THE FOLLOWING ARE STEPS YOU CAN TAKE TO REDUCE ITS VISCOSITY AND ENSURE OPTIMUM PERFORMANCE:

1. Pump product from the port on the bottom of the tote.
2. If possible, move containers to heated storage or warm the area they are in. Once product reaches 40° F, it will return to normal viscosity.
3. In extremely cold temperatures, Credit Xtreme may thicken. Once it reaches 40° F or higher, it will revert to a liquid with no impact on performance.
