

Tourney® F U N G I C I D E

YOUR ONE SOLUTION FOR BOTH ANTHRACNOSE TYPES.

Anthrachnose, caused by *Colletotrichum cereale*, can be a severe disease on *Poa annua* and bentgrass greens and fairways. Anthrachnose survives on dead and decaying organic matter and becomes pathogenic when grass is stressed. Two forms of anthrachnose are known: basal stem and foliar. Basal stem anthrachnose is more destructive and is prevalent during cool, wet periods in spring. Foliar anthrachnose is common during stressful summer conditions. Tourney® Fungicide is an ideal component of an anthrachnose prevention program, due to its systemic activity within the plant and its highly active chemistry.

TOURNEY DELIVERS

- Outstanding control of anthrachnose plus a broad spectrum of other tough-to-control turf diseases such as dollar spot, fairy ring, summer patch, gray leaf spot and more
- Exceptional turf quality
- Very low use rates = easier handling and application

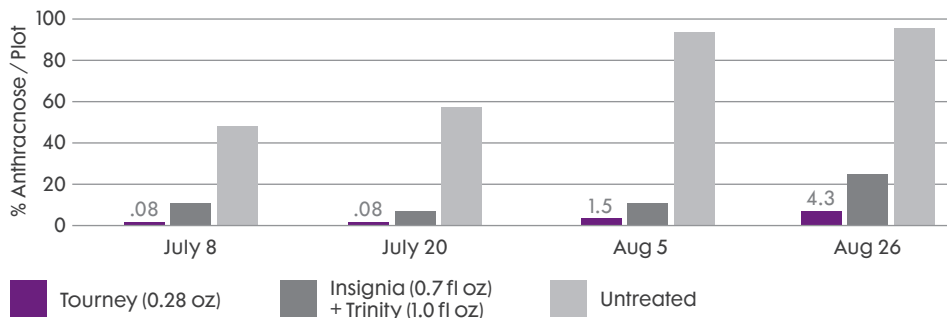

APPLICATION INFORMATION

TARGET DISEASES	APPLICATION RATE	APPLICATION GUIDELINES
Basal stem anthrachnose Foliar anthrachnose	0.28 to 0.37 oz/ 1,000 sq ft	<ul style="list-style-type: none"> • Using high volumes (>3 gals/1,000 sq ft) to ensure proper product placement in the case of basal stem anthrachnose • Using normal water volume when targeting foliar anthrachnose • In the spring, as a preventive, basal stem anthrachnose becomes active when temperatures reach 70° F

TOURNEY = OUTSTANDING ANTHRACNOSE CONTROL

A stand-alone Tourney application outperforms the combination of Insignia® and Trinity® for anthrachnose control.

2011. B. Clarke, Rutgers University. | Site: *Poa annua*, greens height; New Brunswick, NJ. | Treatments application began May 17, 14 day interval.
